## What others say about *Sensako* seed | **Wat sê andere oor *Sensako*-saad**

“SST835 is ’n betroubare en stabiele kultivar wat baie goed aangepas is in ons area. Staanvermoë en roesweerstand is goed. Die groeilengte van die medium groeiers van *Sensako*, soos SST835, werk goed hier en afdroging vir strooptyd is goed. Ons is tevrede met die kultivar, opbrengs is baie aanvaarbaar”. - **Hendrik Odendaal, Villiers**

“Ons familie plant al sedert die 1980’s *Sensako* koring kultivars. Oor die algemeen is ons baie gelukkig met die hele opbrengs, groeiperiode, staanvermoë en siekte verdraagsaamheid pakket van die SSTs. Die wye reeks van groeiperiodes wat beskikbaar is in die SST koring pakket stel ons goed in staat om ons planttyd goed uit te brei. ’n Ander belangrike eienskap wat baie prominent in die *Sensako* genetika is, is die stabiliteit oor jare wat gekoppel is aan die kultivars”. - **Nico Botha, Groblersdal**

“*Sensako* se koring kultivars plant ons al vir ’n baie lang tyd. Vir die omgewing waar ons geleë is, stabiliteit en groeiperiode vir ons baie belangrike faktore wanneer dit by kultivar keuse kom. Die vinnig en medium tot vinnig groeiperiode kultivars is goed aangepas in ons omgewing. Die opbrengste wat behaal word, is ook baie aanvaarbaar. Van die kultivars wat goed by ons presteer is SST835, SST884 en SST8135.” - **Pieter du Plessis, Lichtenburg**

“Die *Sensako* SST reeks bied n uitstekende keuse van kort, medium en lang groei kultivars. Ons plant seisoen is soms tot 2 maande lank en die wye verskeidenheid van SST kultivars help baie om die lang plantseisoen optimaal te bestuur met die regte kultivars. Ons plant al meer as 20 jaar *Sensako* koring en een ding is altyd seker, die uitstekende opbrengs potensiaal en meer belangrik, die stabiliteit jaar na jaar van die kultivars. *Sensako* is ook verbind om die genetiese potensiaal van hul kultivars te verbeter deur n uitstekende teeltprogram in plek te hê,

sowel as veldproewe reg oor Suid-Afrika om die nuwe kultivars deeglik te toets. *Sensako* plant jaarliks by my ook proewe en dit gee my groot gemoedsrus om te sien deur die streng maatreëls waardeur kultivars gaan voor dit kommersieel beskikbaar is”. - **Chris de Villiers, Prieska**

“Ons is baie beïndruk met die goeie stoelvermoë en aarvrugbaarheid wat die *Sensako* kultivars beskik. Ons het SST8154 die jaar vir die eerste keer geplant en sovêr is ons baie beïndruk. Vir ’n vinnige groeier stoel die kultivar baie goed. Die halms lewer ook are met hoë vrugbaarheid. Die staanvermoë, wat vir ons baie belangrik is, is uitstekend. Wat ook ooglopend is, is hoe groen die blare is. Dit is vir ons ’n goeie teken van hoe gesond die kultivars is en ook die stikstof verbruikings vermoë”. - **Rudolf Burger, Jan Kempdorp**

“Van die kultivars van *Sensako*, bly SST806 al vir die afgelope 16 jaar vir ons ’n staatsmaker. Dit is ’n goeie kultivar met goeie stabiele opbrengs gekoppel aan goeie siekte weerstandbiedendheid en staanvermoë. Dit is ook die eerste kultivar waarmee ons 10 ton per hektaar gestroop het. SST806 se stabiliteit van sand na swaargronde is ongelooflik. Die nuwe kultivars van *Sensako* proef ons ook nog elke jaar en vind dat hulle ook goeie hoë opbrengste haal”. - **Hein Mulke, Douglas**

“By ons in die wisselende omgewing van die Wes-Vrystaat presteer SST347 die beste van die *Sensako* droëlandkultivars. Die kultivar tref die oog en presteer meestal onder wisselende produksie omstandighede. Die kiemkragtigheid van die kultivar is veral ’n bate”. - **Le Grange Odendaal, Wesselsbron**

## WHEAT: Crop Yield Trials

### Sensako's wheat trials.

The yield data presented in the tables is data generated from Sensako's own multi-locality yield trials. These trials cover the whole of the irrigation and dryland areas of central and northern South Africa extending along the Orange River, up to the Lowveld of Limpopo, the high areas of Natal, the Free State and North West. For the dryland production areas, trials are planted across the Free State. On average 10 irrigation and six dryland research trials are planted each year.

### How to interpret the trial results.

The trial design that Sensako normally uses is a complete randomised block design. In simple terms, it is a trial design where each entry in the trial is repeated in three different randomisations. The reason for the repetition and randomisation is to ensure that data is generated three times at each trial location, and also to ensure that an entry does not appear next to itself (the same entry) at every repetition.

In using this specific design, certain advantageous statistical methodologies can be utilised, to identify the best performing cultivars in a specific area.

Some of the specific statistical parameters which appear on the yield tables, are the coefficient of variation (CV) and the Least Significant Difference (LSD).

The CV is an indication of how reliable the trial has been. The smaller the variation of a specific entry within the repetitions is, the lower the CV and the higher the reliability of the trial. A low CV of between 0 and 15% is accepted as a good trial.

A high CV indicates a high degree of variation between randomisations and indicates that the data generated may not be reliable. An example of a high CV trial can be explained as follows: In repetition one, a specific entry yielded 6 ton/ha. in repetition two, the same entry yielded 8 ton/ha and in the third repetition, 10 ton/ha. The variation is therefore high between the randomisations and indicates that there may be a high degree of variation in soil/growing conditions through the trial. The data generated from such a trial is therefore not reliable.

Another very useful statistical parameter coming from a complete randomised block design is the least significant difference (LSD). LSD helps to group cultivars which perform similarly and is useful in identifying a group of cultivars that do not differ statistically in an area. This enables producers to enjoy a wide choice of cultivars that may perform very much the same in a particular area.

A trial with a LSD of 0.45 ton/ha means that there is no statistical difference between the top performing cultivar and any entry that yields LESS than 0.45 tons than the top performer. It is therefore important not to place too much reliance on trial ranking as there may not be a (statistical) difference between a number of top performing cultivars. Performance of a variety in a performance trial should always be measured taking into consideration the LSD of the trial. Another advantage of LSD is that it can identify and group cultivars with different growth periods into the same yield group enabling producers to identify a portfolio of top performing cultivars with differing growing periods.

## KORING: Opbrengsproewe

### Sensako se koringproewe.

*Die opbrengsdata wat in die tabelle voorgedra word, is die data wat afkomstig is van Sensako se eie multilokaleiteit-opbrengsproewe. Onder besproeiing en droëland beslaan Sensako se koringproewe die hele besproeiings- en droëlandgebied van die sentrale en noordelike gebiede van Suid-Afrika. Onder besproeiing strek die proewe van al langs die Oranjerivier tot in die Laeveld van Limpopo en die hoogliggende gebiede van Natal, Vrystaat en Noordwes. Onder besproeiing word elke jaar 'n gemiddeld van 10 lokaliteite geplant. In die sentraal-droëland-koringproduksieareas beslaan die proewe die hele Vrystaat. Daar word gemiddeld elke jaar ses lokaliteite oor die Vrystaat geplant.*

### Hoe om die proefresultate te interpreteer.

*Die proefontwerp wat oor die algemene gebruik word, is 'n volledige ewekansigheidsblokontwerp. In eenvoudige terme is dit 'n proefontwerp waar elke inskrywing in die proef herhaal word in drie verskeie ewekansighede. Die rede vir herhaling en ewekansigmaking is om te verseker dat data gegenereer word van elke inskrywing drie keer op 'n lokaliteit en ook dat elke inskrywing nie by elke herhaling langs dieselfde inskrywing staan nie.*

*Deur die spesifieke ontwerp te doen, kan sekere statistiek op die proef geïmplementeer word, wat help om kultivars uit te wys wat die beste vir 'n spesifieke omgewing presteer.*

*Van die spesifieke statistieke parameters wat in die opbrengs tabelle te voorskyn kom, is die koëffisiënt van variasie (KV) en die kleinste betekenisvolle verskil (KBV).*

*Die KV is 'n aanduiding van hoe betroubaar die proef op sigself was. 'n KV van tussen 0 en 15% word aanvaar as 'n goeie proef. Hoe kleiner die*

*variasie van 'n spesifieke inskrywing oor die herhalings is, hoe laer is die KV en hoe hoër is die betroubaarheid van die proef. Wanneer daar 'n proef is waar daar groot variasie was tussen die verskillende herhalings, sal die KV hoog wees (groter as 15%).*

*'n Voorbeeld van 'n hoë KV-proef kan soos volg geskets word: In herhaling een het 'n spesifieke inskrywing 6 ton/ha gegee, in herhaling twee het dieselfde inskrywing 8 ton/ha gegee en in herhaling drie 10 ton/ha. Die voorbeeld skets 'n prentjie waar daar 'n groot grondneiging (trend) is waar herhaling een in 'n swak kol staan en herhaling drie in 'n goeie kol. Die data wat uit so proef gegenereer is, is dus nie betroubaar nie.*

*Die een baie nuttige statistieke parameter wat uit so volledige gerandomiseerde blokontwerp uitkom, is die kleinste betekenisvolle verskil (KBV). Die parameter help om kultivars te groepeer wat statisties dieselfde presteer in 'n omgewing. Waar KBV's baie nuttig is, is om 'n groep kultivars uit te wys wat baie dieselfde presteer in 'n omgewing wat produsente in staat kan stel om 'n wye keuse te hê van kultivars.*

*'n Goeie voordeel van die KBV parameter is om top presterende kultivars uit te wys.*

*As daar na 'n voorbeeld gekyk word en ons neem 'n KBV van 0.45 ton/ha, beteken dit dat as daar verskeie kultivars in die topposisie geleë is en daardie kultivars se opbrengste verskil nie meer as 0.45 ton/ha tussen mekaar nie, presteer die groep kultivars statisties dieselfde. Daar kan 'n situasie wees waar die top-4-kultivars waarvan die opbrengste nie meer as 0.45 ton/ha met mekaar verskil nie dus statisties dieselfde presteer. Wat die parameter nog meer belangrik maak, is dat dit verskillende tipes groeiperiode kultivars kan groepeer in dieselfde opbrengsgroep en die produsent dan help om 'n groter verskeidenheid kultivars met gemoedsrus te plant.*

# Lentekoring aanplanting Oktober 2016 – Bethlehem

Spring planting October 2016 - Bethlehem

Dryland | **Droëland**

- Opbrengsproewe geplant in Oktober 2016 geplant was opgevolg deur goeie November reën
- Besonderse goeie opbrengs deur kultivars vrygestel vir lente aanplantings asook goeie opbrengste behaal deur besproeiingskultivars in vergelyking met tradisionele droëland kultivars
- Yield trials planted in October 2016 followed up by good rainfall in November.
- Exceptional yields achieved by new cultivars released for spring wheat plantings. Good yields achieved by the irrigation cultivars when compared to the traditional dryland cultivars

# Lentekoring aanplanting Oktober 2017 – Bethlehem

Spring planting October 2017 - Bethlehem

- Opbrengsproewe geplant in Oktober 2017 geplant was nie opgevolg deur goeie reën nie wat 'n beduidend negatiewe effek op opbrengs gehad het
- Goeie opbrengste is behaal deur kultivars vrygestel vir lente aanplantings asook redelike opbrengste behaal deur besproeiingskultivars en was steeds beter in vergelyking met die van die tradisionele droëland kultivars
- Yield trials planted in October 2017 was not followed up by good rainfall which had a severe impact on the yields achieved.
- Good yields were achieved by new cultivars released for spring wheat plantings as well good yields achieved by irrigation cultivars which were still better compared to the yields of the traditional dryland cultivars.

# Effek van groeireguleerders:

## Opbrengs vergelyking 2019 vs langtermyn (2017 tot 2019)

- Opbrengsproewe geplant in Prieska om die effek van groeilreguleerders op koring te toets. Let op die verskil tussen die opbrengste van verskillende kultivars.
  - 'n Belangrike aspek om in gedagte te hou is dat verskillende kultivars nie dieselfde reageer nie en dit dus belangrik is om sulke behandelingss op kultivars te toets voor dit op grootskaal aangewend word.
- Yield trials were planted in Prieska to test the effect of growth regulators on wheat. Note the differences between the yield achieved for the different cultivars.
  - An important aspect to keep in mind is that different cultivars react differently to such treatments and it is therefore important to test the different cultivars before applying such treatments on a large scale.
